projects

AI & ML

We have implemented:

Development of a software add-on for a TV console

- Tracking feature with list of watched programs
- Camera snapshots from console
- AI determines how many, which user watched, what kind of shows, at what time, with what engagement and other parameters
- Views analytics
- Full protection of personal data on both the console and the server

Web portal implementation with a mobile app for a TV channel

- Based on the information collected, we developed a "smart" content aggregator. It generates news, articles, videos, and advertising content for those who have interacted with the console. The content is duplicated in the mobile application.

AI & ML

Applications design based on Artificial Intelligence

- Development of information systems using artificial intelligence, machine learning, and computer vision technologies. Implementation of services in the finished information system.

AI training of datasets / Training neural networks

- Markup of photogrammetric data
- Markup of text documents
- Markup of video clips
- Classification of marked objects
- Semantic segmentation.
- Preparation of data (datasets) for training
- Classification and verification of datasets
- Preparation of machine learning models based on a wide set of neural network architectures.
